1 Encryption & Decryption Process

Encryption of a payload

encryptedKey = Base64Encode(RSA/ECB/PKCS1Encryption(SesionKey,ICICIPubKey.cer)) Session key is nothing but randomly one time generated string of length 16 (OR 32).
encryptedData = Base64Encode(AES/CBC/PKCS5Padding(Response,SessionKey))

Sample Request Packet which is used for encryption.
Plain Request:

```
{
        "URN":"13517981323",
        "MobileNo":"7032771013",
        "DOB":"15/02/1994"
}
```

1. Generate 16-digit random number (session key). Say RANDOMNO. RANDOMNO = 1111222233334444

2. Encrypt RANDOMNO using RSA/ECB/PKCS1Padding and encode using Base64. ENCR_KEY = B64Encode(RSA/ECB/PKCS1Encryption(RANDOMNO,ICICIPubKey.cer))

3. Perform AES/CBC/PKCS5Padding encryption on request payload using RANDOMNO as key and iv-initialization vector. Say ENCR_DATA. ENCR_DATA = B64Encode(AES/CBC/PKCS5Padding(REQUEST_DATA, RANDOMNO, IV))

4. Now client may choose to send IV in request from one of below two options. (a) Send Base64 Encoded IV in “iv” tag. (Recommended Approach) (b) Send IV as a part of ENCR_DATA itself. bytes[] iv = IV; bytes[] cipherText = symmetrically encrypted Bytes (step3) bytes[] concatB = iv + cipherText; ENCR_DATA = B64Encode(concatB);

5.. Now in the complete request, Client needs to send encrypted request in below format.

```
{
"requestId":"<request-idfortrackingpurpose>",
service":"",
"encryptedKey":"<ENCR_KEY>",
"oaepHashingAlgorithm":"NONE",
"iv":"<IV>",
"encryptedData":"<ENCR_DATA>",
"clientInfo":"",
"optionalParam":""
}
```

Example:

```
{
   "requestId": "",
   "service": "",
   "encryptedKey":

    "oaepHashingAlgorithm": "NONE",
    "iv": "",

    "clientInfo": "",
    "optionalParam": ""
}

Decryption of a response

1. Get the IV- Base64 decode the encryptedData and get first 16 bytes and rest is encryptedResponse. bytes[] IV= getFirst16Bytes(Base64Decode(encryptedData)

2. Decrypt encryptedKey using algo (RSA/ECB/PKCS1Padding) and Client's private key. sessionKey = B64Decode(RSA/ECB/PKCS1Decryption(encryptedKey,ClientPrivateKey.p12,)) Session key is randomly generated string of length 16 (OR 32) .

3. Decrypt the response using algo AES/CBC/PKCS5Padding. Response = Base64Decode (AES/CBC/PKCS5Padding Decryption(encryptedData,SessionKey, IV))

4. You need to skip first 16 bytes of response, as it contains IV.

Sample Response used for example:

Response:

```
                {
                  "AccountInfo": {
                        "URN": "13517981323",
                        "AccountNumber": [
                        "003601547744",
                        "019801005262"
              ]
          }
      }
```
